Paediatric Emergencies for the Primary Care Services

Dr A Raffles

Consultant Paediatrician
Paediatric Emergencies

‘To live through an impossible situation, you don’t need the reflexes of a Grand Prix driver, the muscles of a Hercules or the mind of an Einstein. You simply need to know what to do.’
Paediatric Emergencies

Or, as put by Corporal Jones -

Don’t PANIC Captain Mainwaring!!!!!
What’s a Paediatric emergency

Depends where you look at the problem from!

- Parental/Grand Parental
- School and Social
- Primary care – in Hours and Out of Hours
- Secondary Care – Ambulatory, Emergency Department, In – Patient Unit
- Tertiary Care
Paediatric Emergencies

What are the common emergencies?

How do we recognize the sick child?

Detailed assessment – risk stratification

Triage Tools and how to manage the next stage

Follow through

Questions
UK Overview

Size of the paediatric problem:

- 1995 - 2-3,500,000 children in A/E (1:4-1:6)
- 2007 – 1400 Deaths 1-14 years
- Boys 802 Girls 598
- SIDS 155
- 88 in house fires,
- 2010 211 Killed on Road
UK Overview

Drowning - 42/yr. 30 Boys 12 Girls

7 of these in garden ponds, 12 in bath

Near Drowning 200/year in A/E

50% of Accidents are in the home

158 deaths due to home accidents

50% of Home accidents are to under 5’s
Evidence:

- In 4 years, 107,938 calls have been successfully managed without an adverse clinical outcome. Minor errors in using protocols occurred in one call out of 1450 after-hours calls.

- After-hours phone calls necessitated an after-hours patient visit 20% of the time.

- One after-hours hospital admission out of every 88 calls.

- 50% of the patients were managed with home care advice only.

- 28% were given home care advice after-hours and seen the next day in the primary care setting.

- Of all patients directed by the telephone triage nurses to be seen after hours, 78% were determined to have a condition necessitating after-hours care.
What are the Perceived Emergencies

1. Fever
2. Rash
3. Vomiting
4. Nonpenetrating injury (includes head trauma, limb trauma, bruises, abrasions, etc)
5. Ear complaint
6. Cough
7. Diarrhea
8. Sore throat
What are the Perceived Emergencies

9. Irritability/fussiness
10. Abdominal pain
11. Asthma
12. Upper respiratory tract infection symptoms
13. Medication question
14. Lacerations
15. Conjunctivitis
16. Croup
17. Respiratory distress
18. Constipation
19. Questions regarding previously diagnosed illness
20. Insect bite
In total, 0.9% (119/13,408) of the patients were undertriaged.

In 53% (63/119) of these patients, experts considered undertriage as clinically severe.

In 89% (56/63) of these patients the high reference urgency was determined on the basis of abnormal vital signs.

Undertriage was more likely in infants (especially those younger than three months)

Conclusion Undertriage is infrequent, but can have serious clinical consequences

- To reduce significant undertriage, the authors recommend a systematic assessment of vital signs in all children.
Vital Signs

Age Appropriate

Usable in Telephone and Face to Face Situations

Record Accurately

Validity of Normal values

Usable across the conditions commonly encountered.
Feverish illness in children

Implementing NICE guidance

May 2007

NICE clinical guideline 47
Background: why this guideline matters

Feverish illness in children:

• is the most common reason for children to be taken to the doctor
• is a cause of concern for parents and carers
• can be a result of a simple self-limiting infection or a life-threatening infection
• can have no apparent source.
Key recommendations

Traffic light system
Detection of fever
Clinical assessment
Management by remote assessment
Management by a non-paediatric practitioner
Management by a paediatric specialist
Antipyretics
The Traffic Light System

• Tool for identifying the likelihood of serious illness

• Children with only symptoms and signs in the ‘green’ column are at low risk

• Children with one or more symptom or sign in the ‘amber’ column are at intermediate risk

• Children with one or more symptom or sign in the ‘red’ column are at high risk
### Traffic light system: green

</table>
Detection of fever

In children aged 4 weeks to 5 years measure body temperature by:

- electronic thermometer in the axilla or
- chemical dot thermometer in the axilla or
- infra-red tympanic thermometer.

Use an electronic thermometer in the axilla for children younger than 4 weeks.
Clinical assessment

• Check for any immediately life-threatening features.

• Use traffic light system to check for symptoms and signs that predict the risk of serious illness.

• Look for a source of fever and check symptoms and signs associated with specific diseases.

• Measure and record temperature, heart rate, respiratory rate, capillary refill time and assess for dehydration.
### Symptoms and signs of specific diseases

### Symptoms and signs of specific diseases (2)

| Urinary tract infection (in children aged older than 3 months) | Vomiting  
| Poor feeding  
| Lethargy  
| Irritability  
| Abdominal pain or tenderness  
| Urinary frequency or dysuria  
| Offensive urine or haematuria |
|---|---|
| Septic arthritis/osteomyelitis | Swelling of a limb or joint  
| Not using an extremity  
| Non-weight bearing |
| Kawasaki disease | Fever >5 days and at least four of the following:  
| • bilateral conjunctival injection  
| • change in upper respiratory tract mucous membranes  
| • change in the peripheral extremities  
| • polymorphous rash  
| • cervical lymphadenopathy |
Management by remote assessment

Do symptoms and/or signs suggest an immediately life-threatening illness?

No

Look for traffic light symptoms and signs

If all green features and no amber or red

Child can be managed at home with appropriate care advice

If any amber features and no red

Send child for assessment in a face-to-face setting.

If any red features

Send child for urgent assessment in a face-to-face setting within 2 hours

Yes

Refer immediately to emergency medical care
Management by a non-paediatric practitioner

Do symptoms and/or signs suggest an immediately life-threatening illness?

- No
  - Look for traffic light features and symptoms and signs of specific diseases
    - If all green features and no amber or red
      - Child can be managed at home with appropriate care advice
    - If any amber features and no diagnosis reached
      - Provide parents/carers with a safety net or refer to a paediatric specialist for further assessment
  - If any red features
    - Refer child urgently to the care of a paediatric specialist

- Yes
  - Refer immediately to emergency medical care
Bronchiolitis with Traffic Light Approach

The safety net

The safety net should be one or more of the following:

• verbal and/or written information on warning symptoms and how further healthcare can be accessed
• arranging further follow-up
• liaising with other healthcare professionals, including out-of-hours providers, to ensure direct access for the child if required.
